

# HP Windows Server Packages

HP Windows Servers, operating systems designed for servers, are ideal for businesses who want reliability. Windows Server 2012 provides advanced security control with additional features such as virtualisation. Virtualisation allows for multiple server operating systems to run through the one physical server along with the setup of remote desktop services enabling users to login remotely. This provides for faster and more secure access to applications and data while reducing costs. If you have Windows Server 2003, the HP servers are an ideal replacement as server 2003 expires in June 2015.

## Small Business Windows Server Package 1

UP TO 15 USERS

This HP Microserver is ideal for small businesses that need a Windows server as they may have applications that need to be run on a server or want the enhanced security and management control that comes with Windows Server 2012. The hardware and licence is suitable for up to 15 computers connected.
